Jan:

I have finished the search, and printing the results. I did not see any of the chemicals in your list -- most compounds mentions were sodium-something. This is package I have ready to deliver:

1. Registration information and status info (TRAM) for Day White, Nite White, and Opalescence.
2. Registration records for selected registrations owned by Discus Dental and Ultradent, which have the word white or bright or syringe in the list of goods and services.
3. The hit list for all registrations and applications owned by the two companies. The hit list gives the name of trademark. The columns in the hit list are as follows: Serial Number, Registration Number (if blank, never achieved registration or still pending), D (dead, otherwise it is live and active), r in the circle indicates it is registered (the registration number also indicates it was registered), and the name. If the name field is blank, the trademark is a design only mark and contains no words. (On some hit lists I have enclosed, there is a "V", a "t", or an "i". That stands for "viewed", viewed "text", or viewed "image". It simply means I looked at the record.)

TRAM records. Lots of legal terms in the prosecution history. "Abandoned - Failure to respond" means that the applicant did not reply to an office action, and after six months, the application is abandoned. "Cancelled Section 8" means that the owner did not file the required Section 8 affidavit indicating the mark was still in use 6 years after registration. "Expired" indicates the owner did not renew the registration (trademarks may be renewed forever, the current term is 10 years between renewals).

X-Search records: The Goods and Services (GS) field also indicates the International Class (IC) and date of use. I started out searching IC 3 because that is dentifrice and toothpaste. But syringes are in IC 10 (medical), and a lot of records seemed to have IC 5 (pharmaceutical, etc) in them. So, I ended up searching all three international classes (the classes are very broad subject categories -- much easier than patent classification!

Date of first use and Date first used in commerce. The date of first use is the date the trademark was used anywhere. The date first used in commerce is the date "it" crossed state lines and was used in interstate commerce. The trademark must have been used in interstate commerce before it will be registered by the USPTO. A catch-22 situation -- the applicant puts a lot of money on the line for a brand name, and if the USPTO refuses to register, all that money could be lost. ITU stands for "intent to use". Applicants may file a trademark application if they intend to use the trademark, but are not currently using it. The allowance is for six months, and may be requested 2 more times, for a total of 18 months. This acts an informal way to "reserve" a name (there are additional fees). Since the applicant does not have an actual date of use in commerce, the filing date acts as a date of first use for our examiners. Trademark law says whoever used it first, gets priority. Some ITU applications are abandoned because the mark was never used in commerce.

I think the rest of the fields are self explanatory.

I am attaching a copy of my search strategy. The \$ is our truncation character. [bi,ti] is the field designator for the name field, [gs] for goods and services, [ic] for international class, and [on] for owner name. The rest is standard Boolean logic.

I hope that these records provide some background, if not the actual information Examiner Rose may need. Please give me a call or an email if there are any questions!

Subject: RE:

Linda -

This is already very helpful. I doubt that the trademark records would describe the particular components, but if you need such details, one compartment must contain a peroxide / percarbonate / perborate / persulfonate of some kind, most preferably hydrogen peroxide or urea peroxide or carbamic peroxide.

I won't be at the office tomorrow, and perhaps not Friday, either. I have a friend who will undergo surgery, and I am taking her to the hospital where I will wait for her to be released, and then will take her home with me to care for her until Sunday. She lives alone, is undergoing eye surgery, and will have patches on her eyes (and we think we have difficulties...).

Please don't go out of your way! If your bus does stop in front of CM-1, then I would appreciate your leaving the envelope whenever you can. You can ask for Paula Sheppard, my colleague, whose office is quite close to mine; she will be glad to help. Otherwise, just send it via the internal mail service. I'm just disappointed that I won't have the pleasure of meeting you this time.

Thank you again so very much for your good care and fine help. Have a great day, Linda!

Jan

Jan:

I still have a lot of work to do on this request. I have meetings and desk until 3:00PM, so I doubt I will be able to get the results to you today. I should be able to drop them off Thursday on my way in to work (my bus stops at CM-1).

In the meantime, I have searched Discus Dental and Ultradent as owners of trademarks. I viewed these records. The goods and services field is very vague "cosmetic tooth whitener", etc. so I have no idea if any of these consist of two compounds and two compartments. Discuss Dental (new name Discus Dental Impressions) (Day White, RN 2,202,653) indicates the first use was 19971103. For Night White (RN 1,746,277), the first use was 19920703. For Ultradent and "Opalescence", the oldest date I can find (RN 1,662,181) is 19900514. Again, I need to stress that the data in the record lists only "toothpaste" or "whitener" and may not be what you are looking for.

More later.

Linda -

The Discus Dental web site uses "N I T E W H I G H T" or "N I T E W H I G H T" for their product.

Hi Linda -

Here is the trademark search request for Examiner Shep Rose, TC 1600, AU 1614 (308-4609) :

DAY WHITE or DAYWHITE

NIGHT WHITE or NIGHTWHITE (Discus Dental)

OPALESCENCE (Ultradent or Ultra Dent)

These are dentifrice, or tooth paste, toothpaste, tooth gel, tooth cream, mouthwash, mouthrinse, mouth wash, mouth rinse, oral or dental care compositions, oral or dental hygiene compositions, etc....

Please make your search strategy as comprehensive as possible.

My phone number is 308-4498, fax number 308-4496.

Thank you so very much for your good help! I enjoyed speaking with you!

Jan

AB Disclosed is a **dental bleaching** gel compn. having a long shelf life for use with an activator system to cause accelerated **bleaching** action of a peroxide **bleaching** agent in the **bleaching** gel compn. when applied upon a **tooth** surface and to a method for applying and activating a **dental bleaching** gel upon a **tooth** surface for cosmetically **whitening** the **tooth** and/or for the treatment of **stains** or **discolorations** over a shortened time period. The **dental bleaching** gel has a pH independent thickening agent, a stabilizing agent for the peroxide **bleaching** agent and a FD&C approved dye. The activator system comprises an activator for accelerating the **bleaching** action of the peroxide **bleaching** agent and an applicator for storing the activator in a dry form **sepd.** from the **bleaching** gel compn. such that upon contacting the applicator to the **bleaching** gel compn. The

peroxide **bleaching** agent contained in the gel is activated with the applicator being used to substantially simultaneously apply the **bleaching** gel to the **teeth** to be **bleached**. The activator is selected from the group consisting of manganous chloride, manganous citrate, ferrous sulfate, sodium carbonate or bicarbonate, and catalase.

AB Disclosed is a two component whitening dentifrice compn. which exhibits rapid whitening of stained or discolored teeth. The compn. comprises a first dentifrice component contg. a peroxide compd. and the second component contg. Fe ion-implanted silicate clay, the first and second dentifrice components being maintained sep. from each other until dispensed for application to teeth requiring the removal of stain and discoloration. A dentifrice compn. contg. Fe laponite D and H2O2 in a sep. compartment, was prepd.

AB	<p>A formulation is provided as a conc. for producing a biocidally active soln. The formulation comprises a water sol. oxidant generator-peroxide source (e.g. hydrogen peroxide, sodium perborate or potassium peroxy monosulfate) and is in the form of: either a single-pack powder that is dild. and dissolved to produce the biocidally active soln. or a twin-pack liq. or liq.- and -solid formulation which (when the components are mixed or are dild., mixed and dissolved) provide the biocidally active soln. The formulation may optionally comprise a buffer (e.g. citric acid), an oxidant stable surfactant, a metal sequesterant (e.g. ethylenediamine tetramethylphosphonate), a peroxide reactant/trigger, a corrosion inhibitor, a color, a perfume or an indicator which improves effective hygiene performance. Tetraacetyl ethylene diamine (TAED) may be included as a potentiating ingredient which, under slightly alkali conditions of a buffered soln., is activated to produce a very effective low temp. biocide, by reacting with peroxide anions to produce peracetic anions. This combination of hydrogen peroxide, peracetic acid and peracetic anions is synergistic and produces a rapidly biocidal and sporicidal soln. with a very broad spectrum of activity. It may be used as a sterilant/sanitizer in medical, veterinary and food establishments (e.g. sterilizing medical and dental instruments).</p>

AB	The invention relates to a teeth whitening product contg. accessory components , in addn. to a teeth whitening compd. and peroxidase as a combined product that is used simultaneously, sep. or gradually over time. According to a preferred embodiment, the whitening compd. is hydrogen peroxide or a hydrogen peroxide precursor. The product is useful for whitening teeth and can be used as a dentifrice , collutory or for dental treatments.

AB A two-component tooth whitening system which incorporates an increased peroxide content, wherein the components are adapted to be mixed and applied to the teeth from a dental bleaching tray is provided. A first component includes both carbamide peroxide and hydrogen peroxide and a second component comprises an

orally compatible activator gel. An example first component contained
 propylene glycol 33.00, Klucel 1.98, glycerin
 9.42, Cab-O-Sil EH-5
 4.50, carbamide peroxide 16.20, H2O2 11.80,
 glycerol 14.00, and Polawax 9.00 % by wt.

- AB An oral product is provided for inhibiting tartar formation on the teeth. The product is housed in a container and includes a first compn. contg. a water sol. calcium phosphate salt or monolithic combination of calcium and phosphate salts in a carrier with the first compn. having a pH less than 7, and a second compn. contg. an alk. material and a fluoride ion source in a carrier to achieve a pH greater than 7.5. The first and second compns. are **sepd.** from one another prior to use. When combined upon application to the teeth, the first and second compns. form a system for inhibiting tartar around the teeth. Thus, a gel compn. contained **glycerin** 40.00, **Pluronic F-127** 20.00, **H2O2** 4.29, **CaCl2.2H2O** 2.10, **dibasic sodium phosphate** 1.00, **phosphoric acid** 1.50, **sodium citrate** 0.53, **FD&C Blue No.-1** 0.01, and water to 100%. This was **mixed** with a **toothpaste** compn. contg. **Polyol-II** (70% sorbitol) 40.50, **syloid 63XX** (hydrated **silica**) 15.00, **Sylox-15X** 6.00, **PEG-1450** 3.00, **EtOH** 2.84, **SLS** 2.98, **flavor** 1.10, **cellulose gum** 0.80, **sodium saccharin** 0.54, **menthol** 0.50, **NaF** 0.44, **TiO2** 0.30, and water to 100% by wt.

AB	This invention relates to a safe bleaching prepn. for teeth . The bleaching prepn. comprises two components in sep. containers, i.e. (1) a peroxide gel contg. hydrogen peroxide soln. and fumed silica ; and (2) an activating gel contg. gelation agents, catalysts, buffering agents, redox color indicators, and secondary dyes. The two compns. are mixed in a dispenser just prior to application. A component A contained H ₂ O ₂ 10-35 % and noncryst. fumed silica 20-22 % and a component B contained distd. water 75-90, noncryst. fumed silica 4.75-25, Mn citrate 4.75-15, triethanolamine 0.2-5, Na benzoate 0.2-5, Guinea green B 0.1-1, and Pylaklor acid red LX 6514 0.1-5 %.

AB	An oral product and method is provided for remineralizing teeth. The product includes a first compn. contg. a water sol. calcium phosphate salt or monolithic combination of calcium and phosphate salts in a carrier with the first compn. having a pH less than 7, and a second compn. contg. an alk. material and a fluoride ion source in a carrier to achieve a pH greater than 7.5. The first and second compns. are sepd. from one another prior to use. When combined upon application to teeth, the first and second compns. generate hydroxyapatite depositing same on dental enamel.

AB	A method for whitening teeth is provided which involves applying to the teeth a mixt. of a peroxide and a bicarbonate salt. Advantageously, the peroxide and bicarbonate salt are stored as active ingredients in sep. resp. compns. of a dispensing container. Preferably the dispensing container is a pump in the form of an upper and lower body telescopically engageable one with another, the upper body including at least two hollow and sep. parallel cylinders each contg. one of the compns. These compns. may then be dispensed through relative compression of the pistons within the cylinders. A paste compn. comprises Polyol II (sorbitol and other sugars) 33.60, Syloid 63XX 30.00, NaHCO3 10.00, PEG 32 5.00, Sylox 15x 2.00, flavor 1.00, Na lauryl sulfate 2.98, SD Alc. 38B 2.84, cellulose gum 0.80, Ma saccharin 0.54, menthol 0.50,				

NaF 0.44, Ti dioxide 0.30 wt.% and deionized water balance.

AB	A two-component dental bleaching system is provided wherein the components are adapted to be admixed and applied to the teeth from a dental bleaching tray. One component comprises a dental peroxide gel having a pH from about 4 to about 7 and the other component comprises an orally compatible alk. gel having a pH from about 9 to about 13. The admixing of the components provides a dental bleaching gel having a pH from about 8,5 to about 11 to thereby increase the rate of release of active oxygen and accelerate the bleaching action. A two-component dental gel contained water 18.25, glycerin 10.00, propylene glycol 11.00, xylitol 5.00, 50% hydrogen peroxide 30.00, Poloxamer 407 25.00, eugenol 0.25, peppermint flavor 0.50, in the peroxide gel and water 53.50, glycerin 17.00, propylene glycol 10.00, Poloxamer-407 18.00, peppermint flavor 0.70, dyes 0.30, and potassium hydroxide 0.5% in the alk. gel.

AB	A stable peroxide-contg. mouthwash compn. with relatively low peroxide content (0.005-3 wt.%) consists of 2 components , packaged sep. to be mixed at the time of use. The 1st component comprises an aq. soln. of H ₂ O ₂ and an acid to establish a pH of <4.5. The 2nd component is an aq. or aq.-alc. soln. of surfactants, flavorings, and/or oral hygiene agents and 1-10 wt.% of a buffering salt of a nonvolatile acid to establish a pH >8. After mixing the components in a vol. ratio of .apprx.1:1, the pH of the mouthwash is .gtoreq.7. The mouthwash is effective for cleaning and brightening discolored teeth . Thus, a mouthwash was prepd. by combining equal parts of (1) a soln. contg. 30% H ₂ O ₂ 0.67, citric acid monohydrate 0.00083, and distd. water to 100 wt.% (pH 4.2) and (2) a soln. contg. Plantaren 1200 UP 0.1, Cremophor Recombinant Human 60 0.2, flavoring 0.1, Na saccharin 0.03, NaF 0.045, sorbitol 1.8, EtOH 10.0, dye 0.001, Na citrate 5.0, and water to 100 wt.% (pH 8.7).

AB	An oral compn., particularly a gel, is provided which includes at least 2%, preferably .gtoreq.6% of hydrogen peroxide in a carrier stabilized by a triphenylmethane dye. Particularly useful as the dye are FD&C Blue 1 and FD&C Green 3 at levels ranging from 0.006 to 1 %. Further stability can also be achieved through use of a chelating acid, particularly phosphoric acid. The formulation of was utilized either sep. or in combination with a bicarbonate compn. each of the compns. being held in a sep. compartment of a dual compartment dispenser . A peroxide gel component contained Pluronic F127 20.0, glycerin 40.0, H2O2 (35% food grade) 17.00, Me salicylate 0.50, FD&C Blue-1 0.01, and phosphoric acid (95%) 0.30% by wt., and deionized water balance. A bicarbonate paste component was composed of Polyol II (sorbitol and other sugars) 48.71, Syloid 63XX (abrasive silica) 15.00, NaHCO3 10.00, PEG-32 5.00, Sylox 15x (thickening silica) 6.00, SLS 2.98, SD alc. 38B 2.85, cellulose gum 0.80, menthol 0.50, sodium saccharin 0.50, NaF 0.44, and TiO2 0.23% by wt., and deionized water balance.

AB A **dentifrice** is packaged in a telescopically arranged **multi-cavity dispensing** container having .gtoreq.2 cylinders in an upper body thereof. Peroxide and baking soda are placed as active ingredients in **sep.** resp. semi-solid streams, each stream being in a **sep.** cylinder. Uniform **dispensing** of each stream to deliver relatively equiv. ribbon length of each stream is accomplished by incorporating a polyphosphate salt to adjust viscosity. Preferred salts are tripolyphosphates, hexametaphosphates, and pyrophosphates. Thus, a bicarbonate paste **component** contained polyols (sorbitol and other sugars) 48.70, Syloid 63XX (abrasive **silica**) 15.00, NaHCO₃ 10.00, PEG-32 5.00, Sylox 15x (thickening **silica**) 4.60, flavoring 1.00, TSPP 0.50, SDS 2.98, SD alc. 38B 2.85, cellulose gum 0.80, Na saccharin 4.00, NaF 0.44, TiO₂ 0.30, and deionized H₂O to 100 wt.%. The bicarbonate paste in one cylinder was used in combination with a peroxide gel **component** contg. Pluronic F127 20.00, **glycerin** 20.00, PEG-600 10.00, PEG-1450 10.00, 35% H₂O₂ soln. 4.285, FD&C Blue 0.005, 85% H₃PO₄ 0.15, and deionized H₂O to 100 wt.%. The **dispenser** comprises 2 **sep.**, hollow, parallel cylinders, each contg. a piston to force the flowable contents toward an outlet channel; the materials exiting the 2 outlets flow toward each other to form a single, banded, unmixed stream.

AB A method for **whitening teeth** is provided which involves applying to the **teeth** a **mixt.** of a peroxide and a bicarbonate salt. Advantageously, the peroxide and bicarbonate salt are stored as active ingredients in **sep.** resp. compns. of a **dispensing** container. Preferably the **dispensing** container is a pump in the form of an upper and lower body telescopically engageable one with another, the upper body including at least **two** hollow and **sep.** parallel cylinders each contg. one of the compns. These compns. may then be **dispensed** through relative

compression of the pistons within the cylinders.

AB A method is disclosed for the coextrusion in controlled amts. of at least **two dentifrice components** stored and phys. segregated in a **multicompartmented** collapsible **dispenser** provided with a **partition** which divides the interior vol. of the container into **sep. compartments**, the **partition** being movable in response to a pressure differential developed thereacross upon the application of compressive force to the sidewalls, the individuals **dentifrice components** contg. ingredients which interact when **mixed**, the **dispenser** sidewalls being formed of a resilient plastic material which is deflected upon the application thereto of a deflective force of about 1.0 or greater pounds, the **dentifrice components** being formulated to be equally extrudable at substantially equiv. compressive forces. When the **dispenser** sidewalls are compressed, there is extruded a single-banded unmixed multilayer stream of the **components** contg. the reactive ingredients at ratios predetd. to provide optimum levels for interaction between the reacted ingredients when the extruded **components** are **mixed** in the oral cavity. **Dual compartmented** tubes having a body length of 158 mm were filled with **components** 1 and 2 of a **multicomponent dentifrice**. The compressive force required to extrude **component** 1 and 2 was 2.53 and 2.59 lbs.

AB A method for minimizing damage to gingival and periodontal tissue is
 provided through steps that include delivering a first compn. contg. a
 zinc salt to a receptacle, delivering a second compn. contg. a bicarbonate
 salt to the same receptacle, and transferring within five minutes of
 delivery to the receptacle the combination into the mouth onto the
 gingival and periodontal tissues. Where the compns. are semi-solid such
 as in a **toothpaste** and/or gel, the receptacle is ordinarily a
 toothbrush. Liq. compns. such as mouthrinses may employ an expectorant
 cup as a receptacle. A **dual compartment** mouthwash
 contained a first liq. comprising 35% **hydrogen peroxide**
 4.3, zinc citrate 4.0, dye 0.003, phosphoric acid 0.04, and water balance;
 and second liq. comprising ethanol 24.0, humectant 7.0, sodium bicarbonate
 2.0, solubilizer 0.4, flavor 0.4, saccharin 0.07, and sodium lauryl
 sulfate 0.6, and water for balance. The compn. of these invention
 significantly reduced bleeding, exhibited a significant improvement in the
 modified gingival index and had some effect in reducing plaque.

TI Hamster cheek pouch bioassay of **dentifrices** containing
hydrogen peroxide and baking soda

AU Marshall, Milton V.; Kuhn, Janice O.; Torrey, Charles F.; Fischman, Stuart
L.; Cancro, Lewis P.

CS Dermigen, Smithville, TX, USA

SO Journal of the American College of Toxicology (1996), 15(1), 45-61
CODEN: JACTDZ; ISSN: 0730-0913

PB Lippincott-Raven

DT Journal

LA English

CC 4-6 (Toxicology)

Section cross-reference(s): 62

AB The objective of this study was to det. the effects of **hydrogen peroxide** alone and in combination with 7,12-dimethylbenza[a]anthracene (DMBA) in the oral **cavity** because **H2O2** has been implicated as a complete carcinogen or cocarcinogen in **two** animal models. In the **two** independent studies, golden Syrian hamsters were used to evaluate the carcinogenic and cocarcinogenic potential of **dentifrices** contg. **H2O2** and NaHCO3. In the first study, the cocarcinogenic potential of a **dentifrice** contg. 0.75% **H2O2**/5% baking soda was compared with that of a com. **dentifrice** with similar ingredients except baking soda and **H2O2**. In the second study, the cocarcinogenic potential of a **dentifrice** formulated with 1.5% **H2O2** /7.5% baking soda was compared with a **mixt.** of 3% **H2O2** /baking soda. All materials were applied to the right cheek pouches of exptl. animals, and the left cheek pouches were untreated. In the first study, 0.5% DMBA was administered five times weekly for 20 wk, and the **dentifrices** were applied immediately after the DMBA. **Dentifrices** or mineral oil alone were also applied five times weekly. In the second study, 0.5% DMBA or 0.25% DMBA were applied three times weekly for 16 wk; **dentifrices** (or 3% **H2O2**/baking soda) were applied five times weekly for 16 wk. The **dual-phase** **dentifrice** contg. 0.75% **H2O2**/5% baking soda was not carcinogenic, and in combination with DMBA resulted in no observable acceleration of tumor onset, compared with DMBA alone. In fact, animals treated with 0.5% DMBA and the **H2O2**/baking soda **dentifrice** had a significantly delayed onset of tumor formation than did animals treated with DMBA alone. In the second bioassay, an increased latency period for tumor formation was obsd. with 0.5% DMBA and a **dual-phase** **dentifrice** contg. 1.5% **H2O2** /7.5% baking soda, compared with 0.5% DMBA alone. With 0.25% DMBA, latency was not affected by addn. of the **dual-phase** **dentifrice**. In contrast, animals receiving 0.25% DMBA and 3%

H2O2/NaHCO3 had a significantly lower rate of tumor formation and overall mass incidence. Croton oil also reduced the rate of tumor formation when applied with 0.25% DMBA. Histopathol. examn. of cheek pouches revealed squamous cell carcinomas in the majority of DMBA-treated animals. Cheek pouches of DMBA-treated animals killed at interim times indicated a progression from keratotic changes and/or dyskeratosis at 6 wk with the occurrence of carcinomas in approx. half the animals examd. at 12 wk. No significant histopathol. abnormalities were obsd. in animals not receiving DMBA other than slight keratosis in the oral mucosa of one or two animals per group. These results demonstrated that na oral product contg. baking soda and **hydrogen peroxide** was not carcinogenic, and that baking soda and H2O2 did not enhance the tumorigenicity of DMBA. Furthermore, the tumorigenic response of DMBA was reduced by coadministration of 3% H2O2 and sodium bicarbonate.

AB A dental product is provided in a **dual-compartment dispenser** that includes a first and second compn. in resp. **compartments** thereof. The first compn. includes a zinc salt while the second compn. includes a bicarbonate salt. Preferably the first compn. also contains a peroxygen compd. or a C2-C20 carboxylic acid. The

zinc salt in combination with the bicarbonate salt achieves an enhanced antitartar effect.

AB A dentifrice useful for the treatment of gum disease comprises a gel **component** and a paste **component** which are combined prior to use. The gel **component** comprises H2O2 (I) 0.1-10, a water-dispersible copolymer of acrylic acid crosslinked with polyallyl sucrose 0.05-5, a nonionic cellulose stabilizer 0-2.0, a neutralizing agent selected from NaOH, KOH, N(CH2CH2OH)3, HN(CHMe2)2, and NH3 sufficient to raise the pH to 3-6, and water to 100% by wt. The paste **component** comprises NaHCO3 2-60, a salt selected from KCl, NaCl, MgCl2, MgSO4, Na2SO4, and K2SO4 0-6, a humectant selected from **glycerol**, sorbitol, polyethylene glycol, polypropylene glycol, ethoxylated fatty alcs., propoxylated fatty alcs., or their **mixts.** 2-60, a thickener selected from cellulose gum, Mg Al silicate, and their **mixts.** 0.1-5, and a stabilizing polishing agent selected from bentonite, TiO2, SiO2, MgO, and their **mixts.** 1-30, and water to 100% by wt. The compn. is

dispensed from a collapsible tube comprising 2 compartments, the gel liquifies immediately upon contact with a mildly alk. medium contg. a strong electrolyte thereby causing the release of bactericidally effective amts. of nascent O₂. The effervescence produced in the process activates the flavor contained in the bicarbonate paste and produces a lasting and refreshing taste. A gel component contained 35% aq. I 11.5, H₂O 86.6, Carbopol 934 1.5, Na lauryl sulfate 0.1, hydroxypropyl cellulose 0.3 parts by wt., and 10% NaOH q.s. (pH 3.0-4.5). A paste component contained glycerol 25.0, cellulose gum CMC 7MF 1.54, H₂O 32.71, Mg Al silicate (Veegum) 1.10, Na saccharin 0.60, NaCl 2.0, methylparaben 0.15, propylparaben 0.05, NaF 0.22, bentonite 4.0, TiO₂ 2.0, SiO₂ 4.0, NaHCO₃ 25.0, flavor 1.0, Na lauryl sulfate 0.3 parts by wt., color q.s., and 10% NaOH q.s.

AB A dental prepn. useful in treatment of gum disease comprises a gel component and a paste component delivered from a combination collapsible tube having flexible side walls. One compartment contains a gel formulated with H2O2 1-10, a water-dispersible acrylic polymer 0.05-12, nonionic cellulose gum 0.1-1.5% by vol., a neutralizing agent to raise to gel pH to 3-6, and the balance distd. or deionized H2O. The 2nd compartment contains a paste formulated with NaHCO3 10-50, salt 1-6, and a thickener/stabilizer such as a cellulose gum 1-3% by wt., adjuvants, and the balance H2O. The gel and paste are in equal proportions, by vol. Thus, a gel prepn. contained H2O2 35% aq. soln. (5% in final product) 14.3, Carbopol 934 [9007-16-3] 0.5, hydroxyethyl cellulose [9004-62-0] 0.5, triethanolamine [102-71-6] 0.25, and purified H2O 84.45 parts. The paste prepn. contained NaHCO3 40, NaCl 4.0, CMC 7MF [9004-32-4] 1.44, Veegum F [1327-43-1] 1.17, adjuvants, H2O 31.94 parts.

AB Gels were prepd. at the time and point of application by simultaneously forcing a gelable liq. and gelling agent, which were kept in **sep** . containers, through a common flowpath. **Mixing** of the pressurized **components** was done (a) inside the app., before passing a common sprayhead, or (b) outside the app., by placing 2 **sep.** sprayheads in close proximity to each other. Active agents were incorporated in either or both of the **components**, thereby bypassing storage problems which may arise from incompatibility of some ingredients. Aq. hydrophobic sol systems, aq. macromol. colloidal systems, and organosols can be prepd. in the above manner for applications in medicine, cosmetics, agriculture, sanitation, painting, and other fields. For example, a hypochlorite gel for treatment of burns was prepd. by **mixing** (a) a 6% sol of Laponite SP [37320-78-8] in distilled water and (b) a gelling agent prepd. by **mixing** 2.8 g CaCl₂·2H₂O [10043-52-4] in 50 ml distilled water with 0.1 g NaOH and 2.9 g com. LiOCl [13840-33-0] (30% active ingredient) in 50 ml distilled water. **Components** a and b were stored in **sep.** **compartments** of an aerosol can under fluorocarbon pressure and **mixed** during release in the proportion 4:1.

AB	Otitis externa is treated in dogs and cats by administering to the outer ear of the infected animal a dosage, effective to alleviate the symptoms of the infection, of a substantially non-aq., di-enzymic therapeutic compn., in a liq. or gel fluid carrier. The compn. contains an oxidizable substrate and an oxidoreductase enzyme specific to such substrate for producing hydrogen peroxide upon encountering the environment of the outer ear and further contains an iodide salt and a peroxidatic peroxidase for				

interacting with the hydrogen peroxide to produce a hypiodite biocidal agent. Any unbound water present in the compn. is limited to an amt. not more than about 1.0 wt.% to stabilize the compn. against the prodn. of hydrogen peroxide prior to aural application of the compn. to enhance efficacy of treatment. An illustrative di-enzymic compn. contains glucose, glucose oxidase, potassium iodide and lactoperoxidase in a fluid mixt. of glycerol and propylene glycol.

AB Hydro-activated and/or oxygen-activated aq., enzymic, antimicrobial dentifrices are stabilized against enzymic activation prior to oral application of the dentifrice by incorporating a thickener into the dentifrice formulation to provide the formulation with an enzyme

immobilizing viscosity which inhibits enzymic action during processing and in the dentifrice package. An illustrative, thickened, enzymic dentifrice with this enhancement contains glucose oxidase, glucose, lactoperoxidase and K thiocyanate together with CM-cellulose in an amt. to provide the dentifrice with a viscosity of .gtoreq.800 cP. For example, a toothpaste contained water 30.0, glycerin 38.0, CM-cellulose 6.0, silica 15.0, Na methylcocoyl taurate 2.0, titania 8.0, lactoperoxidase (100 IU/mg) 0.0005, .beta.-D-glucose 1.0, glucose oxidase (100 IU/mg) 0.001, K thiocyanate 0.150 g and flavor q.s. The viscosity of this aq., enzymic toothpaste was 30,000 cP and the toothpaste had an enzymic shelf-life in excess of 2 yrs.

PRAI	US 1993-10841		19930129		

AB An orally chewable, enzymically coated product is provided which, upon chewing, produces an anti-bacterial and bacteriostatic effect in the oral cavity by activation of an enzymic system contained within the coating. The enzymic surface coating is developed, in substantially dry form, from a thickened, aq. coating soln. having a viscosity from about 1,000 to about 50,000 cP and contg. oxidizable substrate and oxidoreductase enzymes specific to such substrate for producing hydrogen peroxide upon oral chewing of the coated product and optionally, but advantageously, further contg. peroxidatic peroxidase and an alkali metal salt of an oxygen accepting anion for interacting with hydrogen peroxide to produce oxidized anionic bacterial inhibitor. An illustrative enzymic system for this

purpose contains glucose, glucose oxidase, potassium thiocyanate and lactoperoxidase. The thickened enzymic soln. suppresses the enzymic reaction during the prepn. and application of the soln. to the surface of the chewable product.

AB An acidified and foamable fluoride gel comprises a gelling agent, a foaming agent, an acidifying agent, and a water-sol. fluoride. The gel is dispensed onto a toothbrush for application to the teeth to be treated to thereby effect fluoride uptake by the dental enamel. The gel provides the same fluoride uptake as a tray fluoride gel, but this result is achieved by a foamable gel with substantially less fluoride than that which is present in a tray fluoride. Thus, a gel contained NaF 2.4, Pluronic F108 1.0, xanthan gum 2.0, hydrofluoric acid 0.5, glycerol 21.3, Na saccharin 0.1, phosphoric acid (85%) 3.0, flavor and color 0.4, and water 69.3 parts.

AB	Foamable fluoride compns., for use in fluoride-tray dental treatments, contain water, dental fluoride, foaming agent, foam-wall thickener, and acidifying agent. A foamable compn. contg. NaF 3.1, sucrose distearate 6.0, glycerol 2.0, 85% H3PO4 4.0, cherry flavor 1.0, and water to 100 wt.% was added to an open-mouth aerosol container and the final aerosol dispensing package was completed and pressurized in the conventional manner. Bovine teeth treated in vitro with this foam showed essentially the same F- uptake as teeth treated with Nupro APF Gel, although the amt. of F- in a dental tray filled with F- foam is <1/2 the amt. of F- in a tray filled with gel. Thus, the F- exposure is significantly reduced despite equal effectiveness, resulting in markedly reduced exposure to F-toxicity in fluoride-tray treatment.

AB	A powd. alginate dental impression compn. contains 0.5-6.0% of polyacrylamide [9003-05-8] which provides a smooth admixt. of the powd. compn. with water during its prepn. The polymer can have a mol. wt. of 200,000 to 6,000,000 and a varying carboxyl content. The compn. contains in addn. 6-12% Ca sulfate and 0.6-1.2% phosphate reaction retarder. A powd. compn. was prepd. from K alginate [9005-36-1] 8.5, CaSO4.2H2O 10.0, tetra-K pyrophosphate 1.0, TiK2F6 1.0, MgO 4.0, color 0.5, diatomaceous				

earth 74.0, Cyanamer P-250 1.0 and Polyox WSN-10 0.3% by wt. The addn. of the polyacrylamide to the compn. not contg. it improved the mixing characteristics of the aq. mix in that the aq. mix did not appear grainy or form lumps.

AB An oral, settable dental compn., esp. for impressions, is prepd. by interaction of a component A contg. an alkali metal alginate in an aq. paste with component B contg. CaSO₄ and a reaction rate retarder such as tetra-Na pyrophosphate in a plasticizer paste, free of unbound water. The incorporation of Cyanamer P-250 [9003-05-8] into the blended components gives a nongrainy smooth texture. Thus, component A was prepd. from Na alginate [9005-38-3] 11, diatomaceous earth 84, K pyrophosphate 1, dextrose 2, diethylene glycol 2, and water 150 parts by wt., preservative and flavor traces. Component B was prepd. from MgO 5, CaSO₄ 45, K pyrophosphate 4, glycerol [56-81-5] 35, silicone oil 5, and diatomaceous earth 6 parts by wt. The premix shelf-life was excellent, ease of mixing very easy, setting time was 3 min and moisture loss was 0.4% by wt. in 30 min.

AB An oral, settable, dental compn. is prepd. by mixing component A contg. an alkali metal alginate in an aq. paste with component B contg. a divalent metal salt such as CaSO₄ and a reaction rate retarder such as tetra-Na pyrophosphate in a fluid plasticizer paste substantially free from unbound water. The rate retarder moderates the rate of reaction between the divalent metal salt and the alginate. Thus, component A was prepd. contg. Na alginate [9005-38-3] 11, diatomaceous earth 84, K pyrophosphate 1, dextrose 2, diethylene glycol [111-46-6] 2, and water 150 parts, preservative and flavor trace amts. Component B was prepd. contg. MgO 5, CaSO₄ 45, K pyrophosphate 4, glycerol [56-81-5] 35, silicone oil 5 and diatomaceous earth 6 parts by wt. Components A and B were mixed and the resulting mixt. evaluated for set time and moisture loss at 72.degree.F. The shelf-life was excellent, setting time was 3 min and moisture loss 0.4% by wt.

PRAI	US 1980-139500		19800411		

AB An agar [9002-18-0] gel topical dressing for coating burns or other skin impairments is prepd. by heating and agitating a mixt. of agar, diethylene glycol [111-46-6] and H2O to solubilize the agar. The resulting soln. is cooled to its gelation temp., and converted to a thermally reversible gel. The dressing has a gelation temp. of 24-49.degree.. A gel comprising agar 5, H2O 45, and diethylene glycol 50 wt.% had a gelation temp. of 40.6.degree. compared to 51.7.degree. for a similar gel with dipropylene glycol instead of diethylene glycol. Tests in rats showed the agar gel increased wound healing and impeded bacterial growth.

AB	Hard abrasion-resistant compns. suited for repairing worn heel and torn portions of tennis shoes were prepd. by compounding elastomeric block copolymers, such as isoprene-styrene triblock copolymers (I) [25038-32-8], finely divided silica or clay, and a solvent to obtain a thick pastelike material, which, upon application and evapn. of the solvent, sets to an abrasion and peel resistant elastomer. Thus, a compn. prepd. from KRATON 1107 (I) 50, NOVACITE L-207A (silica) [7631-86-9] 20, and 1,1,1-trichloroethane gave a compn. which set to a hard elastomer with good abrasion and peel resistance.

	PATENT NO.	KIND	DATE	APPLICATION NO.	DATE
PI	US 3837865	A	19740924	US 1972-313449	19721208
AB	An oral, settable dental compn. is prepd. using a 2-component system in which the components interact to form the compn.; component A contains a polycarboxylic acid such as C36 dimer acid or C54 trimer acid or their mixts. and a reaction rate activator such as an aliphatic org. acid having C2-10 atoms or a Ca, Mg, or Zn salt of the acid or their mixts. in an amt. of 0.25-10% by wt. based on the wt. of the polycarboxylic acid; component B contains a metallic base such as the oxide or hydroxide of Zn, Mg, Ca, or Cu, or their mixts. The metallic base is present in an amt. of 0.1-4.0 parts by wt./1.0 part by wt. of polycarboxylic acid. Thus, a compn. is prepd. in which component A contains dimer acidEMPOL 1018 [9080-23-3]30.0, modified rosin Poly-Pale [9006-46-6] 20.0, and HOAc 0.5 wt. lb and component B contains ZnO [1314-13-2]60.0, MgO [1309-48-4]30.0, and castor oil 10.0 wt. lb. Component A is prepd. by mixing the rosin with the dimer acid and heating the mixt. to 200.degree.F or until the rosin is melted and dissolved in the acid, at which point the HOAc is added to the mixt. Component B is prepd. by mixing the ZnO and MgO with the castor oil at room temp. until a smooth mixt. is obtained. Extrusion tubes are filled with component A and B. Equal amts. of component A and B are dispensed onto a mixing board at room temp. and hand mixed. The mixt. forms a solid, cementitious, coherent mass in 4 min. It is well suited for use as a dental impression material.

NOVELTY - An oral tooth cleaning composition comprises a peracid (I)
 comprising a peroxy amino phthalamide; and 0.01-5 w/w% of **hydrogen**
peroxide or its source that will generate the same amount of
hydrogen peroxide in the composition.

DETAILED DESCRIPTION - An oral tooth cleaning composition comprises a
 peracid for physical contact with an inner mammalian mouth; and 0.01-5
 w/w% of **hydrogen peroxide** or its source that will
 generate the same amount of **hydrogen peroxide** in the
 composition. The peracid is a peroxy amino phthalamide of formula (I).

R = H or 1-4C alkyl;

n = 1-8; and
X = CO or SO₂.

An INDEPENDENT CLAIM is included for a commercial package comprising the above oral tooth cleaning composition together with instructions for its use in whitening teeth.

USE - The tooth cleaning composition is used as gel bioadhesive patch/strip, tooth lacquer, or toothpaste for cleaning teeth (claimed). It can be used as mousse, mouthwash, or powder cream, and may be also formulated for use in **dual-compartment** type dispenser.

ADVANTAGE - The composition has an improved teeth whitening or bleaching effect.

TECH UPTX: 20020919

TECHNOLOGY FOCUS - INORGANIC CHEMISTRY - Preferred Component:

Hydrogen peroxide is present in the form of **carbamide peroxide**.

TECHNOLOGY FOCUS - ORGANIC CHEMISTRY - Preferred Component: The peracid is in the form of a cyclodextrin complex. The peracid is present in the composition in the range 0.01-5 w/w%.

ABEX

SPECIFIC COMPOUNDS - Use of 1 compound (I) is specifically claimed, i.e. N,N-phthaloylaminoperoxyacaproic acid.

EXAMPLE - Two tooth cleaning solutions (A and B) were prepared. Solution A comprised of 0.5 M of sodium hydrogen carbonate (NaHCO₃); while solution B comprised of 0.5 M of NaHCO₃, 0.1% hydrogen peroxide, and 1 w/w% M of N,N-phthaloylaminoperoxyacaproic acid. Stained discs were immersed in respective solution for 15 minutes. After which, each disc was evaluated for % stain removal. The results showed that disc immersed in solution A exhibited darkening or no removal of stain was observed; while disc immersed in solution B exhibited 16% stain removal.

NOVELTY - Treating otitis externa in dogs and cats with a **hydrogen peroxide** generating di-enzymatic composition that makes a biocidal hypiodite in situ in substantially water-free conditions, is new.

DETAILED DESCRIPTION - A treatment for otitis externa outer ear infection in dogs and cats comprises:

(1) applying to the affected ear a non-aqueous therapeutic composition comprising a carrier (80-96 wt.%) selected from glycerol and/or propylene glycol, oxidizable substrate (0.015-0.6 mmol/g), an oxidoreductase enzyme (0.5-500 International Units/g) to make **hydrogen peroxide** in situ, an iodide salt (0.0001-0.01 mmol/g) and peroxidatic peroxidase (0.05-20 International Units/g) which is lactoperoxidase, horseradish peroxidase, iodide peroxidase, myeloperoxidase or mixtures of these to make a hypiodite biocide in situ; and

(2) limiting unbound water to no more than 1 wt.% of the composition to stabilize the composition against **hydrogen peroxide** production until it is in the outer ear.

ACTIVITY - Biocidal; antibacterial. No biological data is given.

MECHANISM OF ACTION - None given.

USE - Useful for treating external otitis externa in dogs and cats.

ADVANTAGE - The use of antibiotics is avoided.

TECH UPTX: 20010518

TECHNOLOGY FOCUS - PHARMACEUTICALS - Preferred Composition: The composition comprises the fluid carrier (90-96 wt.%). The iodide is selected from the potassium, sodium, ammonium or their resulting mixed salts. The reductase system is selected from B-D-glucose or dextrose and glucose oxidase, D-alanine and D-amino acid oxidase or D-glumate and D-glumate oxidase. The oxidizable substrate concentration is 0.025-0.1 mmole/g, the oxidoreductase concentration is 10-40 International Units/g, the peroxidase concentration is 0.1-1 International Units/ml and the iodide concentration is 0.001-0.006 mmole/g. The composition optionally comprises an additional anti-bacterial agent selected from lysozyme, lactoferrin or their mixtures, a thickener to increase viscosity for administering and retaining in the outer ear, and optionally an amino glucose selected from glucosamine, N-acetylglucosamine or their mixtures. The unbound water is limited to no more than 0.5, preferably 0.25 wt.% of the composition.

ABEX

ADMINISTRATION - Given intra-aurally. No dosage is disclosed.

EXAMPLE - A composition for treating external otitis externa in dogs and cats comprises glycerol USP 15.410 g, propylene glycol 79.623 g, Klucel(TM) MFF 0.44 g, benzyl alcohol 3.006 g, hydrocortisone 1 g, potassium iodide 0.045 g, beta-D-glucose 0.301 g, water 0.150 g, glucose oxidase 0.001 g, lactoferrin 0.008 g, lysozyme 0.008 g and lactoperoxidase 0.008 g.

NOVELTY - A two-component dental bleaching system comprises (a) a dental peroxide gel having pH 4-7, and (b) an orally compatible alkaline gel having pH of 9-13. The components are admixed and applied to the teeth from a dental carrier. Admixing provides a gel having pH of 8.5-11 to increase the rate of release of active oxygen from the peroxide and accelerate the bleaching action.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for: (i) a two-component dental bleaching system wherein the components are adapted to be admixed and applied to the teeth from a dental bleaching tray for sustained contact, the system comprises: (a) as a first component, a dental peroxide gel having a pH of 4-7 and containing **hydrogen peroxide** in an amount of 7-30 wt %, eugenol in an amount of 0.1-0.5 wt %, poloxamer in an amount to provide a high gel strength, gel modifying aliphatic polyol, and water to 100 %; and (b) as a second component, an orally compatible alkaline gel containing: an alkali metal hydroxide in an amount to provide the alkaline gel with a pH of 9-13, poloxamer in an amount to provide a high strength alkaline gel, gel modifying aliphatic polyol, and water to 100 %, providing a dental bleaching gel of reduced sensitivity and having a pH of 8.5-11 to increase the rate of release of active oxygen from the peroxide and accelerate the bleaching action; and (ii) method for bleaching teeth which comprises: (1) concurrently extruding first and second components of the dental bleaching system through an admixing dispenser and into the reservoir system of a dental bleaching tray, (2) placing the dental bleaching tray in the oral cavity so as to bring the admixed gel into contact with the teeth to be bleached, (3) maintaining the admixed gel in contact with the teeth for up to one hour or longer per day, and (4) repeating steps (1), (2) and (3) for multiple days to thereby bleach the teeth.

USE - An improved dental bleaching system is provided.

ADVANTAGE - The system has accelerated bleaching action and reduced oral sensitivity.

FS CPI

FA AB

MC CPI: A12-V04B; D08-B08

TECH UPTX: 19990624

TECHNOLOGY FOCUS - INORGANIC CHEMISTRY - Preferred Bleaching System: The dental bleaching system comprises: (a) the dental peroxide gel comprising orally compatible peroxide in an amount of 7-30 wt %, an effective amount of gelling agent to provide a high strength dental peroxide gel, and water to 100 wt %, and (b) the orally compatible alkaline gel comprises: orally

compatible alkalinising agent in an amount to provide the alkaline gel with a pH of 9-13, an effective amount of gelation agent to provide a high strength alkaline gel, and water to 100 wt %. The orally compatible peroxide is **hydrogen peroxide** in an amount of 11-22 wt %. The alkalinising agent is selected from alkali metal hydroxide, ammonium hydroxide, basic alkanolamines and equivalents thereof in an amount to provide a pH of 10-12, it is preferably potassium hydroxide.

TECHNOLOGY FOCUS - POLYMERS - Preferred Gelling Agent: The gelling agent is poloxamer or gelling equivalents thereof. The poloxamer is polyoxyethylene polyoxypropylene block copolymer having an average molecular weight of 3,000-15,000 (10,000-15,000) and the polyoxyethylene portion thereof constitutes 30-80 (70-80) wt % of the molecule.

TECHNOLOGY FOCUS - ORGANIC CHEMISTRY - Preferred Gel: The dental peroxide gel also includes gel modifying aliphatic polyol in an amount of 15-30 wt %. The gel modifying aliphatic polyol is selected from propylene glycol, glycerin, mixtures thereof and equivalents thereof.

ABEX

EXAMPLE - A peroxide gel was prepared comprising water (18.25 wt %), glycerin (10.0 wt %), propylene glycol (11.0 wt %), xylitol (5.0 wt %), hydrogen peroxide (50 %) (30.0 wt %), Poloxamer 407, eugenol (0.25 wt %) and peppermint flavor (0.50 wt %). An alkaline gel was prepared comprising deionized water (53.5 wt %), glycerin (17.0 wt %), propylene glycol (10.0 wt %), Poloxamer 407 (18.0 wt %), peppermint flavor (0.70 wt %), color (0.30 wt %) and potassium hydroxide (0.50 wt %). The peroxide gel and alkaline gel were adapted to be admixed and dispensed into the reservoir system of a dental bleaching tray, such as a custom-fitted dental tray, for application to the teeth to be whitened.

NOVELTY - The sterilisation of a medical device uses a **multi-**

chambered compartment with at least first and second rigid chambers (2, 4), each chamber independently serving as a sterilisation chamber and can be operated independently; an open and closed interface (6a) between the **two chambers** and a source of sterilant to provide the sterilant in first and/or second chamber.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for: a method of sterilising the interior and exterior of a lumen device by placing the device (40) in a **multi-chambered** compartment with first and second chambers where the lumen is partly in first chamber and partly in second chamber across the interface. A sterilant is then introduced into the **multi-chambered** compartment from a source of sterilant and this creates a flow of sterilant between first and second chamber through the lumen (42).

USE - A system with **multiple chambers** used for chemical sterilisation of medical devices.

ADVANTAGE - A simple and effective method of vapour sterilisation of articles with both long, narrow lumens as well as shorter, wider lumens, with independently operable chambers.

AB US 5817695 A UPAB: 19981125

Elemental nutritional product (A) for cancer patients comprises: (a) carbohydrate providing 2-25 % of the total caloric requirement; (b) fat providing 40-80 % of the total caloric requirement; and (c) elemental essential and non-essential amino acids providing the balance to 100% of the total caloric requirement. Component (c) includes (wt.%): 0-5 phenylalanine; 2-6 L-tyrosine; 5-11 L-methionine; and 20-35 L-leucine. Also claimed is an elemental nutritional product (B) for cancer patients comprising: (a') carbohydrate providing 2-15 % of the total caloric requirement; (b') fat providing 60-75 % of the total caloric requirement; and (c') elemental essential and non-essential amino acids providing the balance to 100% of the total caloric requirement. Component (c') includes (wt.%): 2-4 phenylalanine; 3-5 L-tyrosine; 6-9 L-methionine; 2-5 L-glutamine; 2-6 L-lysine; 20-25 L-arginine HCl; and 24-30 L-leucine.

USE - The compositions are used to provide cancer patients with nutrition while suppressing cancer growth.

ADVANTAGE - The compositions are high in fat, low in carbohydrate and have an imbalance of amino acids, phenylalanine, L-tyrosine and L-methionine being present in lower than normal amounts and L-leucine being present in excess to suppress cancer growth.

Dental device comprises: (a) a 2-part telescopic dispensing container, with the upper part including at least 2 hollow and separate parallel cylinders (each with a closed end and an open end that accommodates a piston to force any flowable material towards the open end when the cylinders and pistons are compressed relatively); and (b) outlets which link with outlet channels in the cylinders, which are unconnected but which cause the flowable materials to flow together to afford a single, banded, unmixed stream. One of the semi-solid flowable materials (A) comprises a peroxide (I) and the other (B) comprises a bicarbonate salt (II). Each of (A) and (B) are stored separately in the above cylinders and at least 1 comprises 0.05-20% of a synthetic linear anionic polycarboxylate (III) or a polyphosphate (IV).

USE - The device is used to dispense dental compositions.

ADVANTAGE - The device including delivers uniform amounts of each stream in ribbons, allowing more accurate dosing than prior art devices.

 A tooth whitening gel compsn. comprises **carbamide peroxide** dispersed in an anhydrous gelatinous carrier.
 The carrier comprises (by wt. of total compsn.):
 (a) a polyol (any glycerol not more than 10%);
 (b) a thickener containing neutralised carboxypolymethylene and cellulosic ether soluble in the polyol; and
 (c) 0.1-1.5% xanthan gum.
 ADVANTAGE - The xanthan gum stabilises the tooth whitening compsn. against viscosity degradation during oral use, allowing reduced amounts of polymethylene to be employed.

 Dual component dentifrice composition comprises a first dentifrice component containing a peroxide compound and a second dentifrice component comprising an abrasive incompatible with the peroxide compound. The two components are maintained separate until dispensed and combined

for application to teeth to be whitened.

The peroxide compound is preferably **urea peroxide** and the abrasive is silica, or alumina, preferably calcined alumina. A peroxide activator, preferably a manganese coordination complex, especially Mn gluconate is contained in an amount to activate the peroxide compound when the two components are combined for use. The abrasive dentifrice component also comprises an antibacterial agent (preferably Triclosan), a potassium salt (preferably potassium nitrate to treat dentin hypersensitivity, and a vitamin compound preferably vitamin C.

USE - The composition is useful for whitening human teeth and for removing stains.

ADVANTAGE - The composition has improved whitening of teeth and may be used at home.

An anhydrous tooth whitening gel composition comprises **carbamide peroxide** dispersed in an anhydrous gelatinised carrier comprising (a) a liquid polyol where glycerin, if present, is limited to no more than 10 wt.% of the composition; and (b) a thickener containing neutralised carboxypolymethylene and cellulosic ether soluble in the liquid component. The composition has enhanced package stability; reduced tooth sensitivity and improved thixotropic properties.

Also claimed is the method of use of the gel.

USE - The composition is used for whitening teeth (claimed). The whitening gels can be packaged in (1) syringes for dispensing into custom-fitted dental trays that are usually worn at night but can be worn during the day, typically over a period of 10-14 days; (2) gel dispensing tubes or bottles for extrusion into general purpose dental trays for carrying out the dental whitening process; or (3) in pre-packaged dental trays.

ADVANTAGE - The gel has improved package stability and rheology and reduced sensitivity during use compared with conventional dental bleaching gels.

AB WO 9711676 A UPAB: 19981021

Compsn. for bleaching teeth by contact contains a cpd. (A) contg.
H2O2 and a matrix (B) for application of (A) to a tooth surface.
(B) comprises a thickener (I), a stabiliser (II) for (A), an agent (III)
for adjusting pH, giving a pH of 6-10 during bleaching, and a
calcium-chelating agent (IV).

Also claimed are (i) a method for bleaching teeth by applying the
compsn. to the teeth; and

(ii) a dosage delivery unit comprising a multi-
chamber vessel in which each chamber responds to an externally
applied pressure so that a mixt. of reagents in a compartment is forced to
leave the compartment through a mixing baffle in response to the pressure.

The combined reagents comprise the compsn.

USE - The compsn. is used at home to bleach the teeth of humans and domestic animals.

ADVANTAGE - The compsn. gives a detectable bleaching effect within 30 minutes (claimed), and is stable and easy to use, and uses smaller amts. of H2O2. It can be applied by means of a dental tray. Irritation of hard and soft tissues, tooth sensitivity, and ingestion of the compsn. are reduced.

Method for inhibiting gingival bleeding and improving the texture and consistency of gingival and periodontal tissues comprise: (a) delivering a first compsn. (I) contg. 0.1-10 % by wt. of a zinc salt into a receptacle; (b) delivering a second compsn. (II) contg. 1-80 % by wt. of a bicarbonate salt; (c) transferring the combination of first and second compositions from the receptacle to the mouth within five minutes of their delivery; and (d) agitating against the gingival and periodontal tissues.

Also claimed is a process where (I) and (II) are applied to a toothbrush and brushed on the teeth.

USE - The compsns. may be toothpastes, gels or mouthwashes, pref. presented in a dual compartment package for simultaneous delivery.

ADVANTAGE - The separate compositions prevent the decomposition problems of prior art, and are free from chlorinated cpds. The treatment is safe, effective and does not stain the teeth. The taste is acceptable to the consumer.

 A method of whitening stained or discoloured teeth in the oral cavity
 comprises applying a two component whitening compsn. The compsn comprises
 a first component comprising a peroxygen cpd in a vehicle and a second
 component comprising a manganese coordination complex cpd in a vehicle.
 The two components are maintained separately until dispensed and mixed
 prior to application to the teeth. The manganese cpd interacts with the
 peroxygen cpd and activates it to cause accelerated release of active
 oxygen and allowing the mixed components to remain on the teeth for
 sufficient time to effect rapid whitening. Also claimed is a two
 component whitening dentrifice compsn which exhibits rapid whitening of
 stained or discoloured teeth and comprising a first component comprising a
 peroxygen cpd in a vehicle and a second component comprising a manganese
 coordination complex cpd in a vehicle. The two components are maintained
 separately until dispensed and mixed prior to application to the teeth.
 Advantage - The compsn is more effective than existing prods
 available to the consumer. Active oxygen is released quickly and in large
 quantities facilitating convenient effective home use by the consumer as
 well as professional use by the dentist.

 MC CPI: D08-A; E05-L03A; E31-E; E35-S
 ABEQ US 5648064 A UPAB: 19970820

A method of whitening stained or discoloured teeth in the oral cavity
 which comprises applying to the teeth a two component whitening
 composition, which will whiten stained or discoloured teeth, when applied
 to it, the composition being comprised of a first component containing in
 a vehicle a safe amount of a peroxygen compound effective to whiten teeth,
 and a second component containing a manganese coordination complex
 compound in a vehicle, the manganese compound being present in the vehicle
 in an amount effective to activate the peroxygen compound, the first and
 second components being maintained separate from each other until
 dispensed for application to the teeth, dispensing and mixing the
 separately maintained components so that the manganese compound of the
 second component interacts with the peroxygen compound of the first
 component whereby the breakdown of the peroxygen compound and the release
 of active oxygen is accelerated and then allowing the mixed components to
 remain on the teeth for a time sufficient to effect rapid whitening of it.

AB US 5453284 A UPAB: 19951109

An aq. enzymatic dentifrice (I) of water content over 10 wt.% contains, per gram (I): (a) oxidisable substrate, 0.015-0.6 millimoles; (b) oxidoreductase enzyme specific to the substrate for producing **hydrogen peroxide** in application of (I), 0.5-5000 IU; and (c) non-toxic, ambient, water soluble-thickener, in amt. to provide (I) with a viscosity of 800-75,000 cps, to stabilise (I) against prodn. of **hydrogen peroxide** prior to oral application.

ADVANTAGE - In prior dentifrices containing (a) and (b), the water content has been limited to not more than 10 wt.% to provide maximum stability and shelf life. Present compsn. contains a higher amt. of water to improve application characteristics, and stability is provided by adding (c) to increase the viscosity of the dentifrice, and stabilise it.

AB WO 9401800 A UPAB: 19971030

Contact lenses, partic. soft lenses, are disinfected by placing in
 H2O2 soln. (10) in a case chamber (4) and the soln. is neutralised
 by a catalase tablet (7) which is not coated and is placed in a
separate chamber (6) or special position. Admission of

soln. to this chamber or position is controlled by the generation of oxygen by reaction of soln. and enzyme.

Also claimed is a case comprising chambers for right and left lenses, and a channel between these and a chamber for the tablet. An opening for free access of soln. is located just under the tablet, this controlling neutralisation speed by regulating the air stream between the chambers.

USE/ADVANTAGE - The method provides simpler control not requiring the use of a coated tablet.

ABEQ EP 649541 B UPAB: 19971013

A method for disinfection of contact lenses comprising the steps of placing the contact lenses (10) in a cleaning fluid in th form of **hydrogen peroxide** in a container; and carrying out neutralization of th cleaning fluid by means of a tablet (7) containing a neutralization agent catalase, characterised by the step of placing aid tablet containing the enzyme catalase, in a **separate chamber** (6) or in a special position within said container, such that the admission for the cleaning fluid to this chamber or this position is controlled b the generation of oxygen by the reaction between the cleaning fluid and the enzyme catalyst, whereby disinfection of the contact lenses (10) and neutralization of the cleaning fluid, respectively are controlled by means of said tablet (7).

A packaged effervescible mouthwash comprises first and second liquid components including respectively **hydrogen peroxide** and sodium bicarbonate as functional ingredients.

The package consists of a container with two discrete compartments each with an upper outlet end. A closure covers the compartments and includes an inclined crown with a peripheral skirt sized to engage a surface of the container in a fluid-tight manner. Two pouring spouts extend upwardly from the upper surface of the crown each connecting with one of the compartments.

A flat cover is secured to an upper portion of the crown. It has two downwardly depending plugs receivable in corresponding through openings in the crown to close the container.

USE/ADVANTAGE - The mouthwash generates fresh effervescence at the time of use. The package gives improved stability to premature reaction and improved dispensing. Oral hygiene components e.g. anti-caries, anti-calculus, anti-plaque and antimicrobial agents may be added as required.

System comprises: (a) a kit suitable for a single patient and consisting of a tray with at least 2 compartments (1 contg. a sealed container of 30-35% by vol. H2O2 (I), and another comprising a mixing chamber and contg. fumed silica (II)); (b) means for mixing (I) and (II) to afford a paste; (c) an applicator to apply the paste to teeth; and (d) a cover sealed to the tray to allow retrieval of the (I) before exposing (II).

The (I) container is pref. an ampoule with a frangible neck. Mixer is pref. a spatula (pref. in a 3rd compartment), which also serves as the applicator. Amts. of (I) and (II) are pref. sufficient to treat a single patient.

ADVANTAGE - The system provides dental professionals with a high concn. of H2O2 in a safe, effective and easily controllable vehicle for delivery to the reqd. site. The (I)/(II) paste is readily handled, and acts as bleach and a polishing agent at the same time.

Dual-compartment dispenser dental prod., for maintaining protection against caries formation, comprising: (A) a first

compartment contg.: (i) 0.1-10% by wt. of a peroxygen cpd., which provides H2O2; (ii) a physiologically-acceptable F contg. cpd. to inhibit formation of caries on teeth; and (iii) a tin cpd., other than SnF2, to stabilise (i) against decomposition by (ii); and (B) a second compartment contg.: (i) 0.1-30% by wt. of an alkali metal bicarbonate; and (ii) a F contg. anticaries cpd., in the same amt. as in (A); is new.

USE/ADVANTAGE - The prod. is for caries inhibition and promotion of gum health. H2O2 is destabilised by both fluorides and bicarbonates, necessitating **dual compartments**; further, the fluoride must be given in controlled amt. so that all the fluoride should not be in the bicarbonate compartment. As tin cpds., esp. stannous cpds., stabilise H2O2 against fluoride decomposition, fluoride can be present with the tin and peroxy cpds. without effect on prod. stability, thus solving the regulatory problem. Also for regulatory purposes, the tin cpd. is desirably not SnF2, most pref. SnCl2, in amt. 0.005-5% by wt..

 Oral toothpaste compsn. comprises (by wt.): (a) a gel consisting of
 0.1-10% (of (a)) of a peroxygen cpd. (I), and a flavour agent (II)
 incompatible with bicarbonate salts (Me salicylate, cinnamic aldehyde,
 clove oil or mixts.); and (b) a paste comprising 0.5-80% (of (b)) of a
 bicarbonate salt (III), and menthol (IV) as a flavour agent compatible
 with (III), but no (II). Components (a) and (b) are held in
separate compartments of a dual
compartment dispenser, and are present in ratio (a):(b) =
 2-1:1-20.
 Gel (a) contains (by wt.) 20% 'Pluronic F127' (RTM), 40% glycerol,
 4.285% H2O2 (as 35%), 0.5% Me salicylate, 0.005% FE&C Blue,
 0.15% H3PO4 (as 85% w/w), and H2O (to 100%). Paste (b) contains (by wt.)
 48.71% Polyol II, 15% 'Syloid 63XX' (RTM), 10% NaHCO3, 5% PEG 32, 4.6%
 'Sylox 15x' (RTM), 2.98% Na lauryl sulphate, 2.85% SD alcohol 38B, 0.8%
 cellulose gum, 0.5% (IV), 0.5% Na saccharin, 0.46% NaF, 0.3% TiO2, and H2O
 (to 100%).
 ADVANTAGE - The peroxide-bicarbonate dual component toothpaste is
 formulated with a relatively wide range of flavours. Neither the flavours,
 nor the toothpaste itself are degraded, even on extended storage.

 An oral composition comprising: (A) a first component comprising: (i) a
 peroxygen compound present in an amount from 0.1 to 10% by weight of the
 first component; (ii) a first flavour agent which is reactively
 incompatible with bicarbonate salts, said first flavour agent being
 present in an effective amount to impart a flavour taste; (B) a second
 component comprising: (i) a bicarbonate salt present in an amount from 0.5
 to 80% by weight of the second component; (ii) a second flavour agent
 which is reactively compatible with said bicarbonate salt, said second
 flavour agent being present in an effective amount to impart a flavour
 taste, said components being held in separate areas of a container for
 said oral composition, and relative amounts of said first and second
 components ranging from 2:1 to 1:20.

Foamable fluoride compsn. for pressurised dispensing into the trough of a dental tray as a dense, stable, non-flowable foam comprises: (a) water soluble dental fluoride in an amt. to provide the compsn. with 0.5-5 wt.% fluoride; (b) orally compatible, acid stable nonionic foaming agent comprising ethoxylated polyoxypropylene adduct of propylene glycol of ave. mol.wt. 3000-15000 and the ethoxylated portion comprising 30-80 wt.% of the molecular the nonionic foaming agent being present at 2.5-11 wt.%; (c) acidifying agent to give pH 3-4.5; (d) 0.05-0.2 wt.% HF; and (e) water to 100 wt.%.

Also claimed is a method for treating teeth comprising dispensing the above pressurised and foamable fluoride compsn. from an acid resistant aerosol container into the trough of a dental tray to form a fluoride foam within the trough, and superimposing the trough of the dental tray and its fluoride foam content about and into engagement with the teeth to be treated to effect fluoride uptake by the teeth.

USE/ADVANTAGE - The compsns. contain less fluoride than prior art compsns. whilst achieving the same fluoride uptake.

The kit comprises a housing to accommodate a toothbrush head, formed as a hexahedral parallelepiped and holding a measured amount of baking soda and a container with oxygenating agent, movement of the head within the housing mixing the baking soda and agent. An inward top surface on the housing provides an opening for the head while restricting its lateral movement.

The container is pref. of similar shape to the housing and shares a common longitudinal side wall with it, so that the inward top surface is in a generally figure-8 shape. Alternatively, the baking soda may be in a cylindrical container and the oxygenating agent may be supplied in a container holding measured units. The a agent is pref. **hydrogen**

peroxide.

USE/ADVANTAGE - For treatment of swollen and infected gums, eliminates the inconvenience of measuring and mixing.

A therapeutic toothpaste dispenser comprises a hemetically sealed container capable of being pressurised. It contains a supply of a therapeutic toothpaste which includes **hydrogen peroxide**, sodium bicarbonate and sodium chloride. A valve controls the discharge of the toothpaste, and a propellant in the container causes discharge of the toothpaste on actuation of the valve. Pref. the dispenser includes a flexible nozzle which can be used to apply the paste directly into the mouth.

USE/ADVANTAGE - The dispenser is particularly designed to supply a ready-mixed toothpaste for treatment of periodontal diseases. The use of the dispenser simplifies and reduces the time required in an antibacterial therapy for treating periodontal diseases.

AB DE 3630849 A UPAB: 19930922

Prepn. comprises mixing 2 separately conditioned components (A) and (B) delivered simultaneously from 2 containers which are provided with a deformable wall, so that successive pressing by the user results in simultaneous compression and discharge of components. The outlets of the 2 containers are adjacent or close to each other and arranged so that fluids meet when discharged, and the outlets can be opened simultaneously.

The new feature is that the viscosities (V; measured at a laminar flow rate of 45 reciprocal sec. with a 'Rotovisco RV100' Hake viscometer at 25 deg.C) are: VA and VB, and (VA-VB) not over 1500 cps and V (mixt.) not over 3000 cpds. The ratio vol. of A/vol. of B=0.2-2, and the cross-section of each orifice is 0.1-75 sq.mm. Also new are delivery devices useful in this method.

USE/ADVANTAGE - Method is esp. used for direct application of a specified amt. of cosmetic compsn. (including partic. materials which react together, e.g. oxidn. dye components or bleaches) to the skin or hair. It eliminates the need for a separate A/B mixing step, so is simple, less time consuming and avoids material losses.

0/2

FS CPI GMPI

FA AB

MC CPI: D08-B; J02-A01

ABEQ GB 2180215 B UPAB: 19930922

A process for forming in situ a cosmetic compsn for direct application to the skin and hair, by mixing two constituents A and B to be simultaneously dispensed comprising the steps of : (a) taking two adjacent containers each having a wall which is deformable such that simultaneous compression can be effected by successive squeezing actions by the user so as to dispense the contents of said containers and having outflow orifices which are either close together or able to be brought into proximity with each other such that their outflow jets meet each other, said outflow orifices being adapted to be opened simultaneously and each having a cross-section of from 0.1 to 75 mm²; (b) selecting constituents A and B which have individually and when mixed respective viscosities eta A, eta B, eta (A+B), which, when measured under laminar flow conditions at a rate of 45 s⁻¹ using a HAKE 'ROTOVISCO RV 100' viscometer at 25 deg C, fulfil the following conditions:

eta A is up to 1,500 cP,

eta B is up to 1,500 cP,

eta A - eta B is up to 1,000 cP,

eta A + B is up to 3,000 cP,

and of which said first constituent or said second constituent

includes at least one foaming agent; (c) taking volumes of the constituents A and B which satisfy the relationship: Volume of A/volume of B is 0.2-2, and which provide for the weight of the foaming agent(s) in said first constituent to be 0.1 to 30% of the total weight of the compsn; (d) packaging the constituents A and B separately in respective ones of said containers.

ABEQ US 4823985 A UPAB: 19930922

A hair colouring preparation comprises 2 components, A and B, stored separately in 2 adjacent containers, whose walls are sufficiently flexible to allow the components to be squeezed out. The components flow through separate, adjacent orifices having a cross-section 0.1-75 mm² so that A and B mix immediately outside the orifices. The viscosity of each component is at least 1,500 cP and the mixt. has a viscosity at least 3,000 cP. One component contains 0.1-30 wt%, pref. 1-20 wt%, referred to preparation, of a foaming agent. The vol. ratio A:B is 0.2-2.

Each container is pref. a sealed bag of a flexible material. The USE/ADVANTAGE - Esp. for bleaching using NH₃ and H₂O₂; loss of

NH3 is avoided allowing a better bleaching effect to be obt'd. then previously.

AB EP 202359 A UPAB: 19971119

Compsn. comprises a gel component (A) and a paste component (B). (A) consists of (by wt.) 0.1-10% H₂O₂; 0.05-5% water-dispersible copolymer (I) of acrylic acid crosslinked with polyallyl sucrose; 0-2% nonionic cellulose stabiliser; neutralising agent (i.e. NaOH, KOH, triethanolamine, diisopropylamine and NH₃) to pH 3-6, and water. (B) consists of 2-60% NaHCO₃; 0-6% NaCl, KCl, MgCl₂, MgSO₄, Na₂SO₄ or K₂SO₄; 2-60% humectant (II); 0.1-5% thickener stabiliser (i.e. cellulose gum and/or Mg/Al silicate); 1-30% stabiliser-polishing agent (i.e. bentonite, TiO₂, SiO₂ and/or MgO) and purified water. (II) is glycerin, sorbitol, polyethylene glycol, polypropylene glycol and/or ethoxylated or propoxylated lower fatty alcohol. The two components are mixed immediately before use.

Alternatively component (A) can comprise (i) 0.1-10% H₂O₂; 0.05-5% (I); 2-80% polyol and water, or (2) 2-25% urea peroxidase; 0-5% (I) and the balance glycerin.

USE/ADVANTAGE - The compsns. are useful for control of gum diseases (caused by bacterial infection). They are convenient to use; have a pleasant taste, and ensure that H₂O₂ and NaHCO₃ come into contact only immediately before use (providing more consistent delivery of H₂O₂). (Correct entry)

glycol, propylene glycol, and/or ethoxylated (and/or) propoxylated fatty alcohol as humectant; (iv) 0.1-5% of cellulose gum, and/or magnesium aluminium silicate as thickener stabiliser; (v) 1-30 wt% of bentonite, TiO₂, silica, and/or MgO as stabilising polishing agent; and (vi) purified water.

ABEQ US 4983379 A UPAB: 19930922

New compsn. against gum disease comprises (a): non-neutralised gel of 0.1-10.0% H₂O₂ or 2-25% **urea peroxide**, 0.05-5.0% acrylic acid copolymer crosslinked with polyallylsucrose; 2-80% polyol, and water, and (b); paste comprising 2-60% NaHCO₃; 0-6% salt (NaCl); 2-60% humectant (glycerin); 0.1-5% thickener/ stabiliser (cellulose gum); 1-30% stabilising polisher (TiO₂); F-contg. cpd. (NaF) giving 200-5000 ppm.F and water. Paste and gel are mixed immediately before use.

USE - Useful in the treatment of gum disease.

ABEQ EP 202359 B UPAB: 19940303

A composition useful in combating gum disease comprising: (a) a gel component comprising (i) 0.1 to 10% by weight of **hydrogen peroxide**; (ii) 0.05 to 5.0% by weight of a water-dispersible copolymer of acrylic acid cross-linked with polyallyl sucrose; (iii) 0.0 to 2.0% by weight of a nonionic cellulose stabilizer; (iv) a neutralizing agent selected from the group consisting of sodium hydroxide, potassium hydroxide, triethanolamine, diisopropylamine and ammonia in an amount sufficient to raise the gel pH to about 3 to 6; and (v) purified water; (b) a paste component comprising: (i) 2 to 60% sodium bicarbonate; (ii) 0 to 6% of a salt selected from the group consisting of NaCl, KCl, MgCl₂, MgSO₄, Na₂SO₄, and K₂SO₄; (iii) 2 to 60% of a humectant selected from the group consisting of glycerin, sorbitol, polyethylene glycol, propylene glycol, polypropylene glycol, an ethoxylated lower fatty alcohol, a propoxylated lower fatty alcohol and mixtures thereof; (iv) 0.1 to 5% of a thickener stabilizer selected from the group consisting of cellulose gum, magnesium aluminum silicate and mixtures thereof; (v) 1 to 30% of a stabilizing polishing agent selected from the group consisting of bentonite, titanium dioxide, silica, magnesium oxide and mixtures thereof; and (vi) purified water; said paste component and gel component being combined immediately prior to use.

Dwg.0/7

ABEQ US 4687663 B UPAB: 19971119

Method for cleaning teeth by applying active oxygen aqueous cleaning medium to the teeth and gums in the buccal cavity, comprising: (a) extruding a semi-solid component comprising H₂O₂ as the active ingredient; (b) extruding a second semi-solid component comprising sodium bicarbonate as the active ingredient, one of (a) and (b) being flavoured; (c) placing the components in mutual contact on a toothbrush; and (d) brushing the teeth and gums with the mixture, thus evolving active oxygen, the effervescence associated with the production of the active oxygen enabling the flavour to produce a pleasant taste to disguise the unpleasant taste of the mixture. The components are contained in a **dual compartment** article for storage and delivery which prevents the components from contacting each other prior to their release onto the brush, the article including a means for dispensing controlled quantities of the mixture by applying pressure.

AB ZA 8505018 A UPAB: 19971119

Compsn. comprises a gel component (I) and a paste component (II) which are combined immediately prior to use. (I) contains 0.1-10 (pref. 3.0-6.5)% (all by wt.) H₂O₂, 0.05-5.0 (pref. 1-3)% of a water-dispersible copolymer of acrylic acid cross-linked with polyalkyl sucrose, 0-2.0% non-ionic cellulose stabiliser, a neutralising agent, which is NaOH, KOH, triethanol-amine, diisopropylamine or ammonia, in an amt. of sufficient to raise the gel Ph to 3-6 (pref. 0.3-1.5%) and purified water.

(II) contains 2-60 (pref. 20-40)% NaHCO₃, 0-6 (pref. 0-4)

NaCl, KCl, MgCl₂, MgSO₄, Na₂SO₄ or K₂SO₄, 2-60 (pref. 15-25)% humectant, which is glycerin, sorbitol, polyethylene glycol, propylene glycol, polypropylene glycol, an ethoxylated lower fatty alcohol or a propoxylated lower fatty alcohol, 0.1-5 (pref. 1.0-2.0)% thickener stabiliser, which is cellulose gum and/or magnesium aluminium silicate, 1-30 (pref. 1.5-20)% stabilising polishing agent, which is bentonite, titanium dioxide, silica and/or magnesium oxide, and purified water.

USE/ADVANTAGE - The comps. is useful for treatment of gum disease by the Keyes method (combination of H₂O₂ soln. with NaHCO₃ and NaCl). The comps. have pleasant taste and are neat and convenient to use. Contact between H₂O₂ and NaHCO₃ is permitted only shortly before use thus assuring maximum effectiveness against gum disease. Using the container, a greater and consistent amt. of peroxide is delivered to the use point. If a fluorine contg. cpd. is also included (e.g. NaF or KF), the comps. is also effective against caries. (Provisional basic previously advised in week 8614)

IC A61K007-16; B65D035-22

AB US 4528180 A UPAB: 19971119

Arrangement for combatting gum disease comprises a **double-compartmented** collapsible tube, one compartment contg. an H2O2-contg. gel and the other contg. an NaHCO3- contg. paste. The compartments have a common wall, and each compartment has an orifice through which the contents of the compartment can pass. These orifices are arranged adjacent to each other, so that when the tube is squeezed, equal amounts of the paste and gel are dispensed at the same use point.

The gel comprises (a) 1-10 vol.% H₂O₂, (b) 0.05-1.2 vol.% water-dispersible copolymer of acrylic acid crosslinked with polyallyl sucrose, (c) 0.1-1.5 vol.% nonionic cellulose gum stabiliser, (d) purified water and (e) sufficient NaOH, KOH, triethanolamine, diisopropylamine or NH₃ to provide a pH of 3-6. The gel liquifies immediately upon contact with a mildly alkaline environment contg. a strong electrolyte, thereby causing release of bactericidal nascent oxygen. The paste comprises (a) 10-50 wt.% NaHCO₃, (b) 1-6 wt.% NaCl or MgSO₄, (c) 1-3 wt.% cellulose gum and/or magnesium aluminium silicate as thickener-stabiliser, (d) 5-30 wt.% glycerol, sorbitol, polyethylene glycol or polypropylene glycol as humectant, (e) purified water, (f) 1-40 wt.% CaSO₄, Ca₃(PO₄)₂ or hydrated Al₂O₃ as cleansing-polishing agent, and (g) 0.1-2.5 wt.% sodium lauryl sulphate.

USE/ADVANTAGE - The gel and paste can be dispensed and used in the manner of a toothpaste to treat gum disease caused by bacterial infection. The paste and gel, which must be stored separately since the H₂O₂ would react with the NaHCO₃, react together under buccal conditions to release bactericidally effective nascent oxygen. Compared with the prior art method of dipping a toothbrush in a supply of H₂O₂ and then into a paste of NaHCO₃, NaCl and H₂O, the present arrangement allows control of the quantities delivered, more vigorous release of O₂, improved penetration of active ingredients into the gums, and smoother texture and more palatable taste of t

 A di-enzymatic dentifrice containing, per gram of dentifrice, from 0.015
 to 0.6 millimole of oxidisable substrate and from 0.5 to 500 International
 Units of an oxidoreductase enzyme specific to such substrate for producing
hydrogen peroxide upon oral utilisation of said
 dentifrice and further containing from 0.0001 to 0.01 millimole of a
 thiocyanate salt and from 0.01 to 50 International Units of
 lactoperoxidase for interacting with **hydrogen peroxide**
 to produce a hypothiocyanate bacterial inhibitor, wherein the
 concentration of lactoperoxidase in International Units is at least 2% of
 the concentration of the oxidoreductase enzyme in International Units to
 thereby limit the ratio of **hydrogen peroxide** to
 lactoperoxidase during oral utilisation of the dentifrice, and limiting
 any water present in the dentifrice, bound and unbound, to not more than
 10 wt.%, providing however for the dentifrice in chewable form, the
 unbound water is limited to an amount not more than 1.0 wt.%.
 ABEQ US 4537764 A UPAB: 19930925
 An enzyme contg. toothpaste contains (A) 0.015-0.6, pref. 0.05-0.5, esp.

0.1-0.2 mmol beta-D-glucose and 0.5-500, pref. 1.0-100, esp. 5.0-50 I.U glucose oxidase to produce H₂O₂ when used in the mouth and (B) is stabilised against prodn. of H₂O₂ during storage by limiting the amount of water in the toothpaste to below 10 wt.%.

A non-aq carrier is suitably used for the toothpaste, e.g. glycerol or propylene glycol, usually in amounts of 45-55 wt.% The toothpaste also contains a weak organic acid together with a buffer to establish neutrality as well as usual flavourings, colourants, sweeteners, thickeners, humectants, abrasives and surfactants.

ADVANTAGE - Storage stable enzymatic toothpaste is provided, which generates reasonably predictable amount of H₂O₂ in the mouth.

ABEQ US 4564519 A UPAB: 19930925

Di-enzymatic chewable dentifrice contains per gram of dentifrice, 0.015 to 0.6 millimoles of oxidisable substrate; and 0.5 to 500 International Units of an oxidoreductase enzyme specific to such substrate for producing **hydrogen peroxide** upon oral chewing of the dentifrice; and also contg. 0.0001 to 0.01 millimoles of a thiocyanate salt, pref. sodium-, potassium- or ammon. thiocyanate or mixts. of these, and 0.01 to 50 International Units of lactoperoxidase for interacting with the **hydrogen peroxide** to produce a hypothiocyanate bacterial inhibitor. The concn. of the lactoperoxidase is at least 2% of the concn. of the oxidoreductase enzyme in International Units to thereby limit the ratio of **hydrogen peroxide** to lactoperoxidase during oral chewing of the dentifrice.

One pref. oxidisable substrate is beta-D-glucose and one pref. oxidoreductase enzyme is glucose oxidase.

ADVANTAGE - Hypothiocyanate, a bacterial inhibitor, is produced in situ, during oral chewing of the dentifrice.

AB CA 1167381 A UPAB: 19930925

The dentifrice comprises 0.015 - 0.6 millimole oxidisable substrate (I) and 0.5-50 i.u. of an oxidoreductase specific to (I) for prodn. of H₂O₂ on oral appln. of the dentifrice. It also contains 0.0001-0.01 millimole of a thiocyanate salt (II) and 0.05-20 i.u. of a lactoperoxidase to interact with H₂O₂ and to produce a hypothiocyanate bacterial inhibitor. These amounts are per 1g dentifrice. The dentifrice does not contain over 10 wt. % water, so that it is stabilised against H₂O₂ formation before oral use of the dentifrice.

The dentifrice has antiseptic properties when it is used orally, because of the bacterial inhibitor produced in situ. It does not depend on the natural concn. in the oral cavity of glucose, lactoperoxidase, KCNS etc. for efficacy.

The prepn. of an oral, settable, dental compsn. comprises interacting (A) an aq. paste of Na and/or K alginate; and (B) a slightly water soluble, divalent metal salt (I) and a reaction rate retarder (II) in a fluid plasticiser paste (III) free of bound water. (I) is CaSO₄, FeSO₄, ZnSO₄ and/or a divalent metal salt of fatty acid present in 0.5-1.2 pts.wt. per pt.wt. of (A). (II) is Na and/or K (pyro)phosphate, citrate and/or silicate present in 0.02-0.13 pts.wt. per pt. wt. of (I). (III) is glycerol, propylene glycol, polyether glycol, oleyl alcohol, silicone oil, mineral oil and/or vegetable oil, present in 0.75-2 pts.wt. per pt.wt. of (I).

Also claimed are the two component system of (A) and (B), and the dental compsn. prepd. in this way.

The containment of water from the two component system avoids the problem associated with varying water temp. and dissolved minerals. The presence of humectants and plasticisers enhances stability and impression accuracy.

AB GB 2090272 A UPAB: 19930915

A two component settable dental compsn. comprises (i) an aqueous paste A contg. sodium alginate and/or potassium alginate and (ii) a paste B contg. a divalent metal salt and a reaction rate retarder in a fluid plasticiser, formulated in such a way that a preselected quantity of it contains 0.5-1.2 pts.wt. of metal salt per 1.0 pt. of alginate, and 0.02-0.13 pts. reaction rate retarder and 0.75-2.0 pts. plasticiser per 1.0 pt. of metal salt.

The compsns. can be used in the mouth for taking impressions for use in denture construction, or as study models in orthodontic treatment, and as corrective materials in all types of secondary impressions. They are prepd. simply by mixing appropriate quantities of the two pastes. They are convenient and reliable and give more reproducible results than compsns. made up with tap water, whose performance depends on water compsn. and temp.

IC A01N031-00; A61K031-70

AB US 4291025 A UPAB: 19930915

Dressing comprises 5-12 (esp. 8-10) wt.% agar, 20-75 (esp. 40-55) wt.% diethylene glycol, and water to 100%, is new. Pref. the gel also includes a strengthening agent chosen from sodium borate, potassium borate, potassium sulphate and/or zinc sulphate. The dressing is for coating on burn area or other area of skin impairment. The gel is thermally reversible, i.e. on heating it forms a sol., and the presence of the diethylene glycol reduces the gelation temp. of the resulting sol. to below 49 deg.C (usually 24-49 deg.C), allowing the sol. to be cooled and applied to the burn or wound when it is at a tissue compatible low temp., following which the sol. resets to a gel on the skin. The diethylene glycol also functions as a plasticiser for the gel, and as a humectant to assist the gel dressing in absorbing fluids from the burn or wound. It is postulated that the diethylene glycol also contributes antibacterial properties.

AB US 4269822 A UPAB: 19930915

Antiseptic dentifrice contg. (by wt.) 0.01-0.5% of an oxidisable amino-acid (I) and 50-1000 I.U. of an oxidoreductase enzyme (II) (specific to (I) for producing $\text{NH}_3/\text{H}_2\text{O}_2$ on oral applicn.) is stabilised against premature prodn. of $\text{NH}_3/\text{H}_2\text{O}_2$ by incorporation of 30-60% of a non-aq. fluid carrier (III). In addn. the dentifrice contains not more than 10% H_2O .

(I) may be any D- or L-amino-acid, or glycine. (III) is pref. glycerol or propylene glycol. Prefd. compsns. contain (by wt.) 45-55% (III), and also 4-6% of a buffer (e.g. NaHCO_3), 20-60% abrasive polishing agent, and 0.5-5% of a surfactant (pref. a protein surfactant of dioctyl Na sulphosuccinate). Compsn. is pref. a toothpaste.

The enzyme system is only activated in the mouth, so premature formation of H_2O_2 and NH_3 on storage, etc. is avoided.

AB US 3966090 A UPAB: 19930901

A package adapted for the dispensing of an antiseptic iodine-contg. compsn. comprises a pressure-tight container with means to maintain two ingredients isolated from each other, the first ingredient comprising 2-50 wt. % of potassium or sodium iodide, and the second ingredient comprising 2-30 wt. % hydrogen peroxide, a liquefied gaseous propellant in at least one of the ingredients and valve means communicating with both ingredients adapted to dispense a heated compsn. contg. free iodine. As the compsn. is dispensed in the warmed state the cleaning and antiseptic action is improved. Compsn. contg. a surfactant have the added advantage of causing no staining of the skin and may be used to clean surgeons hands prior to operations, in the treatment of acne and dandruff and in general antiseptic usages. The iodine source may be ammonium iodide, amine iodides, other metal iodides are quat. iodide salts. The peroxy cpd. may be an organic or inorganic peroxide.
